Supplementary Figure S1—Box-and-whisker plots of plasma CoQ₁₀ concentrations in dogs with CHF due to MMVD before and at various points after receiving water-soluble CoQ₁₀ (total daily dose of 100 mg [n = 5] or 200 mg [6]) or a placebo (7) PO for 2 weeks in addition to their regular cardiac treatment. For each box, the horizontal line represents the median; upper and lower box boundaries represent the 75th and 25th percentiles, respectively; whiskers represent the range; and dots represent outlier values. The horizontal line at 0.095 mg/L represents the median concentration measured in 12 healthy dogs.
