Supplementary Figure S1—Percentual increase in inspiratory normalized glottal gap area (NGGA) and each hemi-NGGA in 5 dogs anesthetized with propofol and dexmedetomidine and receiving CO₂ 10% as a respiratory stimulant. One recurrent laryngeal nerve was anesthetized with lidocaine (gray circles) while the contralateral side was not (white circles). The total NGGA (black circles) is also shown. The x-axis indicates the number of video recordings, which were obtained at 15-minute intervals.
