Figure S4: Proprioception Scores: Proprioception scores (median) over a 96 hour period in a population of eight research (seven in the BLS treatment) beagle dogs. One sciatic nerve of each dog was assigned to be treated with either bupivacaine 0.5% plus dexmedetomidine (1 µg mL) at a volume of 0.1 mL kg⁻¹ (BUP-DEX) or a bupivacaine liposome suspension (13.3 mg / mL⁻¹) at a volume of 0.1 mL kg⁻¹ (BLS). The contralateral nerve was assigned to be treated with the alternate treatment. The scores vary from 0 (no evidence of block detected) to 2 (complete block). The time on the X axis is hours post block.
