

Supplemental Figure 1: Timeline of clinical evaluations and blood sample collections for the cancer-diagnosed patients from which detection of residual disease and detection of disease recurrence was assessed. (A) 52 patients met criteria to assess the test’s ability to detect residual disease following excisional surgery, and (B) a subset of 13 patients met criteria to assess the test’s ability to detect cancer recurrence.

*Clinical assessment performed according to the standard of care (SOC) of each clinic.
