Supplementary Figure S1—Radiographs of the right forelimb of fetal samples. The proximal sesamoid bones are not radiographically distinguishable as mineralized structures in any of these samples. (A) 105d fetus. The scapula and all long bones with the exception of the second phalanx are visible as mineralized structures. (B) 150d fetus. The second phalanx is radiographically visible. The tubercle of the scapula, a secondary center of ossification, is visible. (C) 180d fetus. (D) 210d fetus.
