

Supplementary Figure S1—Postoperative radiographic images after total replacement of the right hip joint (A) and left scapular-humeral osteotomy (B) performed at 11 months and 18 months of age, respectively, in a sexually intact male Hungarian Vizsla with presumed multiple epiphyseal dysplasia disease. A—Ventrodorsal radiographic image showing the total hip joint implant in place. B—Ventromedial–dorsolateral oblique radiographic image showing the remaining left scapula and humerus; the dog’s head is toward the upper right of the image.
