**Supplementary Figure 1S**—Initial MRI images of the calvarium of a 7-year-old castrated male Golden Retriever with generalized cluster seizures and mucoid nasal discharge. **A**—Postcontrast transverse T1-weighted MRI image. Notice the homogenously contrast-enhancing mass in the left olfactory bulb and frontal lobe of the cerebrum. Uniform contrast enhancement within the musculature medial to the left orbit can also be seen (asterisk). **B**—Transverse T2-weighted MRI image. The mass was heterogeneously hyperintense on T2-weighted images. **C**—Postcontrast dorsal T1-weighted MRI image. The mass is shown with extension into the left nasal cavity.
