Supplementary Figure 2S—Postcontrast transverse T1-weighted (A) and T2-weighted (B) MRI images of the dog described in Supplementary figure S13 weeks later, showing almost complete regression of the previously noted mass. A—Mild meningeal contrast enhancement is apparent along the left lateral aspect of the left olfactory lobe in the region of the previous mass (arrows). B—There is fluid within the right olfactory lobe which is isointense to CSF and may represent ex vacuo accumulation of CSF (arrow).
