

Supplementary Figure S2—Representative ventral images of the iliac joint margins close to the ileal neck (IN) (A through C; cranial is to the top of the images) harvested from cadavers as described in Supplementary Figure 1. The iliac joint margins imaged show new bone formation (black arrows) along the joint margin itself (lipping; A), and grossly and thickened, bony projection arising from the joint margin, being contiguous with the planar articular surface (modeling; C); there is depression (asterisks) of the joint margin relatively to the normal planar articular surface on the ventral aspect of the articular surface of the ileum (flattening; B).
